

128521 - Delete depreciation area - transport to other systems

Component: FI-AA (Financial Accounting > Asset Accounting), Version: 3, Released On: 18.05.2000

Symptom

If you delete a depreciation area in Asset Accounting Customizing for a chart of depreciation, the depreciation area to be deleted is deleted in this system from all Asset Accounting tables (Customizing table and transaction data tables). However, if as you save the data a transport request is created, only the Customizing tables are included in the transport request, but not the transaction data tables. Consequently, the deleted depreciation area is only deleted in the Customizing tables in further systems in which the transport request is imported, but not in the transaction data tables.

Other Terms

OADB; FI_AA_V_T093_00_AFTER_IMPORT; AA_AFABER_DELETE;
V_T093C_00; ANLB; ANLC; ANEP

Reason and Prerequisites

Only from Release 4.6A, the transaction data in the production system is also deleted automatically during the import of the Customizing request.

Solution

1. So that the deleted depreciation area is deleted from every table in the further systems, the deleted depreciation area must be created in the further systems again in Asset Accounting Customizing. Once you have created the depreciation area, it is essential that you save it before it is deleted again. When you save the data, the depreciation area to be deleted is then deleted from all Asset Accounting tables. Additional information: The depreciation area you have created and deleted again in the further systems can be created in as simple way as possible. What matters is that this area has the same key as the deleted one. To have a proper solution, you must temporarily allow Customizing in the production system (Transaction SCC4).
2. Use Transaction SE37 to call up function module AA_AFABER_DELETE in the test mode. As import parameter enter the chart of depreciation and the depreciation area to be deleted. After this, start the function module. Caution: The depreciation area is deleted from all transaction data without confirmation prompt and the deletion procedure is recorded in the application log.
